

NiKaDa CyberAI Shield

DIGITAL FORTRESS

Advanced, AI-driven threat detection and automated remediation designed for modern enterprises and Managed Security Service Providers (MSSPs). Defending your digital frontier with zero-trust architecture.

Core Capabilities

Threat Detection Engine

Ingests real-time telemetry from endpoints. Utilizes both deterministic rule-based engines and behavioral ML models to detect anomalies and map techniques to the MITRE ATT&CK framework (e.g., catching obfuscated executions).

Automated SOAR

Security Orchestration, Automation, and Response (SOAR) eliminates manual intervention. Active threats trigger automated playbooks, immediately issuing critical remediation commands such as instantaneous host network isolation.

Multi-Tenant Architecture

Designed natively for MSSPs and large enterprises. Data, alerts, and configurations are strictly segregated by Tenant ID, ensuring comprehensive data privacy and role-based access control across independent client environments.

Centralized Command Center

A unified, real-time dashboard granting total visibility over organizational security posture. Monitor live telemetry, investigate generated tickets, and manage isolated endpoints across all tenants seamlessly.

Enterprise-Grade Infrastructure

NiKaDa CyberAI Shield operates on a robust, horizontally scalable microservices architecture. Telemetry is securely processed via high-throughput queues, analyzed by dedicated AI threat workers, and persisted in secure relational stores. The lightweight endpoint agent operates silently with minimal footprint, deploying instantly via native OS scripts.

Trust & Connectivity

Compliance Ready (SOC-2)

Built with compliance at its core. Comprehensive, immutable audit logging records every significant action—from user provisioning to manual threat remediations—ensuring total accountability for SOC-2, CERT-In, and other regulatory frameworks.
